## PRODUCT INSTALLATION INSTRUCTIONS

# ALUMINIZED HEAT SHEATHING

Heat sheathing may seem like a very easy item to install, which it is. However here is a short tutorial with some tips included to make sure your sheathing installs holds up the way it should.

### Items needed:

Scissors  
Paper type stapler  
Measuring tape  
Heat sheathing  
Zip ties (optional)

1. Measure the wire, tube, hose, ect... that you plan on covering with the section of heat sheathing.
2. Measure out the heat sheathing section and make sure you have enough to cover it.
3. Mark the sheathing where you plan to cut it if you need a short section.
4. After cutting the sheathing we suggest you staple the sewn edge of the sheathing just below where you made your cut. This is to ensure that the sheathing does not pull apart or unwind at the stitch while installing.
5. Install the sheathing over the item you are protecting, taking care not to get any type of fuel/oil or any type of flammable liquid on the sheathing as this can become a fire hazard.
6. If necessary use zip ties to secure both ends of the sheathing to hold it in place.
